Chapter- Right Circular cylinder

Topic- Surface area, volume of right circular solid cylinder and hollow cylinder

Right Circular Cylinder

A cylinder whose base is a circle is called circular cylinder. If the axis of the cylinder is perpendicular to its base then the cylinder is called a right circular cylinder.

Different formula related to a solid Right circular cylinder

Let radius of the base and height of a solid right circular cylinder be r unit and h unit respectively.

i) Lateral surface area = $2\pi rh$ sq unit

ii) Area of 2 bases = $2\pi r^2$ sq unit

iii) Whole surface area = $(2\pi rh + 2\pi r^2)$ sq unit

iv) Volume = $\pi r^2 h$ cubic unit

Right circular hollow cylinder

A right circular hollow cylinder (or cylindrical shell) is a three-dimensional region bounded by two right circular cylinders having the same axis and two parallel circular bases perpendicular to the cylinders' common axis, as in the diagram. Let the height be h , internal radius r , and external radius R .

Formula related to hollow right circular cylinder

- i) Volume (solid part) = volume of external cylinder - volume of internal cylinder = $\pi h (R^2 - r^2)$ cubic unit
- ii) Lateral surface area = External surface area + internal surface area = $2\pi R h + 2\pi r h = 2\pi h (R + r)$ sq unit
- iii) Total surface area = Lateral surface area + area of solid bases = $[2\pi h (R + r) + 2\pi (R^2 - r^2)]$ sq unit

SOLVED PROBLEMS

- 1) A solid, metallic, right circular cylindrical block of radius 7 cm and height 8 cm is melted and small cubes of edge 2 cm are made from it. How many such cubes can be made from the block?

Solution: For the right circular cylinder, we have radius (r) = 7 cm, height (h) = 8 cm.

Therefore, its volume = $\pi r^2 h$

$$= (22/7 \times 7 \times 7 \times 8) \text{ cubic cm}$$

$$= 1232 \text{ cm}^3$$

The volume of a cube = (edge)³

$$= 2^3 \text{ cubic cm}$$

$$= 8 \text{ cubic cm}$$

Therefore, the number of cubes that can be made = volume of the cylinder/volume of a cube = $1232/8 = 154$ cubes can be made (ans)

2) The height of a cylindrical pillar is 15 m. The diameter of its base is 350 cm. What will be the cost of painting the curved surface of the pillar at Rs 25 per sq m?

Solution: Here, radius = 175 cm = 1.75 m and height = 15 m

Therefore, the curved surface area of the pillar = $2\pi rh$

$$= (2 \times \frac{22}{7} \times 1.75 \times 15) \text{ sq m}$$

$$= 165 \text{ sq m}$$

Therefore, the cost of painting this area = Rs $(25 \times 165) = \text{Rs } 4125$. (ans)

3) A hollow right circular cylinder has 5 cm external radius, 4 cm internal radius and 1188 sq cm total surface area. What is the height of the cylinder?

Solution: According to the problem

$$2h\pi (5+4) + 2\pi (5^2-4^2) = 1188$$

$$\text{Or, } \frac{22}{7} (9h+9) = 1188$$

$$\text{Or, } 9h + 9 = 1188 \times \frac{7}{22}$$

$$\text{Or, } 9h = 189 - 9$$

$$\text{Or, } h = \frac{180}{9} = 20 \text{ cm (ans)}$$

4) A hollow right circular cylinder has 16 cm external diameter and 12 cm internal diameter. Height of the cylinder is 36 cm. After melting it few solid right circular cylinders with 2 cm diameter and 6 cm height are made. Find the numbers of solid cylinders can be made.

Solution: external radius = 8 cm, Internal radius = 6 cm, height = 36 cm

$$\text{Volume of the hollow cylinder} = \pi(8^2 - 6^2) 36 = 1008 \text{ cubic cm}$$

Radius of solid cylinder = 1 cm, height = 6 cm

Volume of one solid cylinder = $[\pi (1)^2 \times 6]$ cubic cm = 6π cubic cm

Number of solid cylinders = $1008\pi / 6\pi = 168$ (ans)

5) Height of a right circular cylinder is twice of its radius. If height was 6 times the radius then volume would have been 539 cubic dcm more. Find height of the cylinder.

Solution: Let the original height is $2r$ dcm when radius is r dcm

Original volume = $\pi r^2 h = (\pi r^2 \times 2r)$ cubic dcm

New height is $6r$ dcm when radius is r dcm

New volume = $(\pi r^2 \times 6r)$ cubic dcm

According to the problem

$$(\pi r^2 \times 6r) - (\pi r^2 \times 2r) = 539$$

$$\text{Or, } r^3 = 539 \times \frac{7}{22} \times \frac{1}{4}$$

$$\text{Or, } r^3 = \frac{7 \times 7 \times 7}{2 \times 2 \times 2} \text{ therefore } r = \frac{7}{2} \text{ cm} = 3.5 \text{ dcm}$$

Height = (3.5×2) dcm = 7 dcm (ans)

6) Lateral surface area of a right circular cylindrical pillar is 264 sq m and volume is 924 cubic m. Find diameter and height of the pillar.

Solution: let radius and height of the pillar be r unit and h unit respectively

Volume = $\pi r^2 h = 924$ cubic mi)

Lateral surface area = $2\pi r h = 264$ sq m....ii)

Dividing equation (i) by equation (ii) we get

$$\frac{\pi r^2 h}{2\pi r h} = \frac{924}{264}$$

$$\text{Or, } r/2 = 924/264$$

$$\text{Or, } r = 7 \text{ cm} \text{ therefore diameter is } (7 \times 2) = 14 \text{ m}$$

putting $r=7$ in equation (ii) we get

$$2\pi \times 7 \times h = 264$$

$$\text{Or, } h = 6 \text{ m (ans)}$$
